

# P03 Planning and Uncertainty

Suixin Ou

School of Computer Science  
Sun Yat-sen University

November 30, 2021

## Problem 1

In this part, you will implement a simple STRIPS planner.

- Input: the input of your planner is a PDDL domain file and a problem file in the STRIPS restriction, that is, preconditions of actions and the goal are conjunctions of atoms, and effects of actions are conjunctions of literals.
- Output: the output of your planner is a sequence of actions to achieve the goal.

## Grading

- Describe with sentences the main ideas behind computing the heuristic for a state using reachability analysis from lecture notes. (20 points)
- Implement a STRIPS planner by using  $A^*$  search and the heuristic function you implemented.(40 points)
- Explain any ideas you use to speed up the implementation. (20 points)
- Run you planner on the 5 test cases, and report the returned plans and the running times. Analyse the experimental results. (20 points)

# Diagnosing by Bayesian Networks

## Problem 2

- (1) PatientAge: [ '0-30', '31-65', '65+' ]
- (2) CTScanResult: [ 'Ischemic Stroke', 'Hemorrhagic Stroke' ]
- (3) MRIScanResult: [ 'Ischemic Stroke', 'Hemorrhagic Stroke' ]
- (4) StrokeType: [ 'Ischemic Stroke', 'Hemorrhagic Stroke', 'Stroke Mimic' ]
- (5) Anticoagulants: [ 'Used', 'Not used' ]
- (6) Mortality: [ 'True', 'False' ]
- (7) Disability: [ 'Negligible', 'Moderate', 'Severe' ]

$$p1 = P(\text{Mortality} = \text{'True'} \mid \text{PatientAge} = \text{'31-65'} \wedge \text{CTScanResult} = \text{'Ischemic Stroke'})$$

$$p2 = P(\text{Disability} = \text{'Moderate'} \mid \text{PatientAge} = \text{'65+'} \wedge \text{MRIScanResult} = \text{'Hemorrhagic Stroke'})$$

$$p3 = P(\text{StrokeType} = \text{'Stroke Mimic'} \mid \text{PatientAge} = \text{'65+'} \wedge \text{CTScanResult} = \text{'Hemorrhagic Stroke'} \\ \wedge \text{MRIScanResult} = \text{'Ischemic Stroke'})$$

$$p4 = P(\text{Anticoagulants} = \text{'Not used'} \mid \text{PatientAge} = \text{'0-30'})$$

## Grading

- Briefly describe with sentences the main ideas of the VE algorithm. (20 points)
- Implement the VE algorithm (C++ or Python) to calculate the following probability values: (20 points)
  - ①  $p1 = P(\text{Mortality} = \text{'True'} \wedge \text{CTScanResult} = \text{'Ischemic Stroke'} \mid \text{PatientAge} = \text{'31-65'})$
  - ②  $p2 = P(\text{Disability} = \text{'Moderate'} \wedge \text{CTScanResult} = \text{'Hemorrhagic Stroke'} \mid \text{PatientAge} = \text{'65+'} \wedge \text{MRIScanResult} = \text{'Hemorrhagic Stroke'})$
  - ③  $p3 = P(\text{StrokeType} = \text{'Hemorrhagic Stroke'} \mid \text{PatientAge} = \text{'65+'} \wedge \text{CTScanResult} = \text{'Hemorrhagic Stroke'} \wedge \text{MRIScanResult} = \text{'Ischemic Stroke'})$
  - ④  $p4 = P(\text{Anticoagulants} = \text{'Used'} \mid \text{PatientAge} = \text{'31-65'})$
  - ⑤  $p5 = P(\text{Disability} = \text{'Negligible'})$

## Grading

- Implement an algorithm to select a good order of variable elimination. (20 points)
- Compare the running times of the VE algorithm for different orders of variable elimination, and fill out the following table: For test cases p4 and p5, for each of the order selected by your algorithm and 5 other orders, report the elimination with, and the total running time of the VE algorithm. For each case, the first order of elimination should be the one chosen by your algorithm. Analyze the results. (40 points)

## Submission

- **Just choose one problem to solve.** There is no bonus even if you complete both the two tasks. You should finish one of them as well as you can.
- Pack your report `P03_YourNumber.pdf` and source code into zip file `P03_YourNumber.zip`, then send it to `ai_course2021@163.com`.

# The End
